

LOUVOLITE FABRICS ARE CORONA**SAFE**

WHY WOULD YOU USE ANYTHING ELSE?

Louvolite's new coating, when applied to Carnival and Carnival Blackout fabric, renders the surface of the fabric "Coronasafe".

Testing from an independent laboratory found
Louvolite CoronaSafe™ eliminated 99% of the virus from the fabric's surface within one hour.

Choose Carnival and Carnival Blackout, our best selling fabric for roller, vertical and panel blinds.

An essential for homes, offices, schools, hospitality and healthcare sectors who need to make areas where people gather as safe as possible and protect against the spread of Coronavirus.

ELIMINATES **99%** OF CORONAVIRUS IN AN HOUR

Want to know more about the testing process of Louvolite CoronaSafe™?

Currently, the strain related to the pandemic poses a significant threat to people handling it outside of high-level research laboratories - it is therefore not available commercially for use in public test laboratories. In this case and like other outbreaks, such as SARS and EBOLA, the testing industry use a suitable surrogate to represent the target strain that would have representative results of a product's performance.

To test against coronavirus the independent testing laboratory uses feline coronavirus as a surrogate organism, as it poses no risk to staff and shares a strong family design to the outbreak strain with only small differences in RNA. It's currently used in other EN methodologies and has been tested in ring trials, proving to provide reliable and repeatable results.

This allows the test teams to confirm that any result on feline coronavirus would be representative of the results achieved on the pandemic strain, if it was tested, and that they are repeatable by other laboratories.

Provide your customers with that extra layer of defence they need with Louvolite CoronaSafe™
